

Two Celtics : 2 - Shot Profiles

Derrick White Vs Jayson Tatum | 2025-26 Regular Season| NBA Shooting Zones

Question: Where does each player take their shots, and which zones produce the most points per attempt?

Result: Both players relied heavily on above-the-break 3's. Tatum took a larger share of attempts at the rim, while White reeled in more points per attempted 3.

What the data shows

Shot selection: Above the break 3's made up 50.7% of White's attempts and 45.6% of Tatum's. Tatum's restricted area share was 21.6% compared to White's 9.7%.

Scoring Returns: White scored 1.43 points per restricted-area attempt whereas Tatum had a 1.23. Tatum's 1.50 points per corner 3 pointer attempt was the charts highest figure but it has been collected from only 12 total attempts.

Method and Interpretation

1. **Shot Share** = Zone FGA / Player FGA across all 5 Zones(sum)
2. **Points per attempt** = Zone FGM * Shot Value / Zone FGA

3. Corner 3 Combines left and right corners once
4. **Free throws not included**

Limitations

1. Tatum came back during the mid season, so a much smaller sample size is used. (287 attempts across the zone Vs White's 1,180).
2. Zone averages describe the observed shots; Do not look at predicted shots and situations where the player mixed his shot style.
3. Shot Difficulty and defensive contribution and attention not accounted for.
